. . Filescavenger41licensekeygen. A: Update Yes, it can be used to do that. On a Mac, the easiest way would be to install jailbreak, run the app and look for the VNC viewer app in the list of installed apps. That's a free app that would have the remote-wipe functionality. On Windows, there are also lots of remote-wipe tools. One of them is WipeMyPC. Q: How do I avoid a race condition in my webapp? My webapp uses Spring 2.5, Hibernate, Spring security and jstl. I am storing a map in my session object. I am updating this map in several places and I am assuming that I am likely to experience a race condition (I am assuming here). Is it safe to say that all the code in my webapp can have a race condition and therefore be unsafe? Is there any best practice for coding without a race condition? A: If you're doing session management in your application layer, don't use the Session bean directly. Instead, instantiate a Spring bean (e.g. Hibernate SessionFactory) in your web application context and inject the SessionFactory into your application classes. The benefit is that the Hibernate Session will be managed using Spring's transactions, thus avoiding any concerns with race conditions. Edit: To be clear, I'm not suggesting that you use Spring directly, but instead that you use Spring to instantiate your own SessionFactory. A: There is no such thing as a race condition in concurrent programming, it is always a synchronization problem. There are only race conditions. If you were using the Spring Session, Hibernate would internally do all the locking and synchronization for you, but it does mean you need to understand the lifecycle of the Session. If you're not using the Session, as David Stratton said, Hibernate would handle all the locking and synchronization for you. In this case you just need to understand how the Hibernate Session lifecycle works. So if you can design your code so that the use of a Session is not necessary, and if you know how the Hibernate Session lifecycle works, then you can avoid most of the race conditions. If you want to use the Session, and don't 2d92ce491b
