The aims of this study were (a) to explore the experience of revenge as a childhood phantasies and (b) to examine whether the original phantasies still play a role in the lives of children who have been diagnosed with revenge phantasies. Forty-seven children (mean age = 12.01; SD = 3.84) and their families were referred to a specialized treatment center for revenge phantasies in Stockholm. Fourteen had an externalization and 33 had an internalization of their revenge phantasies. All children and their families were treated using a multimodal approach based on Cognitive-Behavioral Therapy (CBT). The participants were assessed at pretreatment, post-treatment, and at 12-month follow-up. This study showed that revenge phantasies were mostly experienced as pleasurable and as a pleasurable anticipation, and that the children tried to act out their revenge through fantasizing, joking, and complaining. The most frequently used strategy was acting out, but the others were also used. At pretreatment, 36.5% of the children also experienced their revenge as hurtful. Treatment was effective in changing the original revenge phantasies of the children. At the follow-up assessment, at least 8 out of 14 children who had externalized their revenge phantasies at pretreatment still fantasized about revenge. The results suggest that the original revenge phantasies of children can play an important role in their everyday lives and that CBT can be an effective treatment for these phantasies.Q: What is the best way to prevent slave from exceeding maximum time limit I am using the Windows service controller to trigger a task. This task checks if the first item of a list is more than 1 minute old and if it is then it will do some operations to the second item in the list. The task is
