There are some known to be able to undelete files, to be able to recover the file, and to be able to recover the file and be able to retrieve the information that is in the file. The software and how to use the software is different depending on what you want to recover. I did this programmatically and I used fs-unix-2.8.3. Here is my source code. A: There are specialized applications that have undelete features. Some of them are commercial and others are free. Most of them don't only undelete the data but also allow you to look at it and possibly recover it. I would check out the links posted by Mihai.

Secure Shredder is a small utility that can help you avoid such unpleasant situations by enabling you to encrypt the content of a file before deleting it. Thus, even if someone somehow manages to recover one of your documents or files, they cannot open it. Despite its name, this application does not actually make a file completely vanish from your hard drive. It functions more like an encryption tool, overwriting the file content at lower level and making it practically unusable. Its simplicity and ease of use is another of its strong points. The GUI consists of a single window, only comprising a field dedicated to entering the file path (or browse for the file using the designated button), right next to a plain button that triggers the operation. Unfortunately, drag and drop is not currently supported. Once the 'Shred' button is pressed, the application prompts you for confirmation. Please note that you should create a backup of the files you want to process with Secure Shredder, since its actions might result in permanent data loss. A 'shredded' file cannot be opened anymore with the default application. We tested Secure Shredder with videos, documents, pictures and everything worked just fine. Secure Shredder is intended to make data recovery a difficult process, with the ultimate goal of ensuring privacy protection. It can prove useful to any user who wants to get rid of a file for good. Regulatory T cells, which control the effector functions of T cells, have gained much attention over the past few years. The immune system primarily depends on T cells for protection against pathogens and cancers. During the activation process, regulatory T cells can suppress or inhibit the immune response in order to maintain immune homeostasis (@B2). Two models of T-cell regulation are generally accepted. Field of the Invention This invention relates generally to a retracting strut for a vehicle seat and, more particularly, to a strut that is pivotally adjustable to restrain the forward motion of a seat when an occupant of the vehicle exits the vehicle. 2. Discussion of the Related Art When a vehicle is occupied, a seat is retained in a horizontal seat position. The restraint provided by a seat belt is often too restrictive to allow the occupant to exit the vehicle in a forward direction (i.e., toward a location behind the vehicle). Consequently, the front of the occupant's body typically contacts the seat belt prior to the rear of the occupant's body exiting the vehicle. To overcome this disadvantage, some vehicles incorporate a rigid retraction strut that initially extends above the front of the seat between the front of the seat and a vehicle frame.
