Patients with renal transplants and cyclosporin A (CsA) have abnormally low levels of serum estradiol, presumably due to decreased production of this sex hormone by the kidney. The role of CsA in production of estradiol was examined in two experiments using data from two different laboratories. Renal function in the first experiment was assessed by measuring serum creatinine, creatinine clearance, and serum CsA levels in 19 stable renal transplant patients in two consecutive studies approximately 1 month apart. In the second experiment, the effect of CsA on urinary excretion of estradiol was assessed in 12 female subjects in two consecutive 24-hour urine samples. After renal transplantation, serum estradiol levels were significantly lower than in control subjects without renal transplants (mean +/- SD: 43.1 +/- 29.7 pg/
